## PROFIBUS Overview

PROFIBUS-DP (Decentralized Periphery) is a device level bus that supports both analog and discrete signals. It permits Mono-master or Multi-master systems, which provides a high degree of flexibility during system configurations. PROFIBUS allows all automation devices, sensors, actuators, PLC's, etc to communicate with each other over a single bus. It communicates at speeds from 9.6 Kbps to 12 Mbps over distances from 100 to 1,200 meters. PROFIBUS-DP doesn't natively support Intrinsically Safe installations.

PROFIBUS-PA (Process Automation) is a full-function fieldbus that is generally used for process level instrumentation. PROFIBUS-PA communicates at 31.25 Kbps and has a maximum distance of 1,900 meters per segment. PROFIBUS-PA is designed to support Intrinsically Safe applications.

## PROFIBUS Network Specifications
